Recipe Browser - Required Document

Project description

For this project I have chosen to create a "recipe browser" that should be scalable for future use. The Recipe browser will give users the ability to search for recipes Through a search bar that filters results by user input from a Recipe list, after choosing a result they will be directed to a page that explains to them step by step how to create said dish along with the nutrition values and ingredients needed by weight.

Feature list

multiple pages
Scalable code
Recipe browsing/ search functionality
Intuitive design
List generation

technical tasks

Creating JS that enables search filtering,
Ensures interactive searches through instant feedback,
And creating code that creates <li> elements with <a> for each entry(recipe) which updates the DOM when ever the filtering is initialized
